

Planting Instructions

There is no need to be exact with the spacing; the plan is intended to be used as a guide. Mulch is a good idea, as it helps keep weeds down and the soil moist. We suggest using dried grass, dried shredded leaves or clean straw as mulch. We suggest watering your plugs before planting as well as after planting. This process can be stressful for plants, but with a good watering they'll feel at home in no time!

1. With small plants such as these, it is easiest to mulch before planting. Spread the mulch 1" deep across the area.
2. Using any kind of markers (stones, sticks etc.) map out a rough plan for the plugs.
3. At a given spot, push the mulch to the side and dig a small hole for the plant, as deep as the plug. Be careful not to mix the mulch with the soil.
4. Gently break the roots if the soil comes out in a rigid shape. Place the plant in the hole with the soil level to the ground. Replace loose soil from around the plant and gently press around the edges. Replace mulch.
5. Water thoroughly.

**Welcome to the Aspetuck Green Corridor.
Congratulations on your new garden!**
